vista / glance

first graphics of c-mails interface - the 4 basic steps > 1 c-mail arrives, 2 c-mail turns, 3 c-mail opens and falls softly, 4 c-mail ready to be generated (new c-mail) or c-mail reproduces its message-making (png - ani)

resumen / brief description >

c-mail is a completely new way of generating and exchanging messages. instead of the alphanumeric code it uses the pixel itself as its basic element. creating a c-mail means to import into c-mails programme a predefined amount of white pixels and arrange those - draw or write - with a line-cursor. its interface is radically simple - it just uses black and white and gives in a first step only the possibility to generate and reply a c-mail. the project is planned to be an opensource freeware and will be launched with these elementary features only. c-mail stands for c a l c - mail (made by c a l c but also made with calc-ulis..).
